

MA 116 B1 Assignment 5

Due Friday Aug 01 11:59 pm

In class discussion of Assignment 5 questions: 12:30-12:50 TueWedThu.

Question 1

A small bike shop owner wants to predict the number of bikes sold on a given day (y) based on the promotion rate (x). They collect a random sample.

index	x_i	y_i
1	0.9	3
2	1	1
3	0.8	4

- (a) Calculate the sample means \bar{x} , \bar{y} , and the sample standard deviations s_x , s_y . Show your steps.
- (b) Calculate the sample linear correlation coefficient r of this sample.
- (c) The least squares regression line of a sample is the line that minimizes the sum of square residuals. Compute the least squares regression line of this sample, using formulas of b_0 and b_1 .
- (d) Compute the predicted values \hat{y}_i and the residuals $y_i - \hat{y}_i$ of the least squares regression line you find in part (c). Fill in the table below.

Index (i)	x_i	y_i	\hat{y}_i	Residual
1	0.9	3		
2	1	1		
3	0.8	4		

- (e) Draw a residual plot. Conclude from the residual plot whether it is reasonable to assume that there is a linear relationship between x and y .
- (f) The small bike shop owner wants to test whether there is a negatively associated linear relation between x and y . That is, whether the number of bikes sold on a given day (y) decreases as the promotion rate (x) increases. Conduct a hypothesis test with $\alpha = 0.1$. You do NOT need to justify that your new variable t follows a Student's t -distribution of a certain number of degrees of freedom.
- (g) Find a point estimator to the population parameter $\mu_{y|0.85}$. Is the point estimator you find the same as the sample mean of the response variable at $x = 0.85$?

Question 2

A student at BU wants to estimate the average time it takes to write a 10-page essay. This student collects a large random sample of data points of the form (x_i, y_i) from the population of all BU students, where x_i is the number of pages in an essay, and y_i is the number of hours a student spent writing that essay.

- (a) Describe the steps of finding a point estimator for $\mu_{y|10}$ from this sample using simple linear regression.
- (b) Would the same point estimator from (a) be appropriate if the goal is to predict the time a random individual takes to write a 10-page essay?
- (c) Interpret what a Confidence Interval for a Mean Response at $x = 10$ is estimating.
- (d) Interpret what a Prediction Interval for an Individual Response at $x = 10$ is estimating.
